L3 ANSWER 8 OF 8 CAPLUS COPYRIGHT 2003 ACS
ACCESSION NUMBER: 1919:11827 CAPLUS
DOCUMENT NUMBER: 13:11827
ORIGINAL REFERENCE NO.: 13:2297e-i
TITLE: Action of enzymes upon starches of different origin
AUTHOR(S): Sherman, H. C.; Walker, Florence; Caldwell, Mary L.
SOURCE: J. Am. Chem. Soc. (1919), 41, 1123-9
CODEN: JACSAT; ISSN: 0002-7863
DOCUMENT TYPE: Journal
LANGUAGE: Unavailable
AB The starches were prepd. from ***wheat*** flour, corn meal, white rice
and mature potatoes in 4 ways: (1) Washing with H2O only, (2) with very
dil. alkali, (3) with Et2O after washing with H2O, and (4) with Et2O after
washing with alkali. The action of saliva, pancreatin, purified
pancreatic ***amylase*** , ***malt*** ext., purified ***malt***
amylase , taka-diastase and purified ***amylase*** of
Aspergillus oryzae on these starches was studied by allowing the enzyme to
act upon a 1% dispersion of the boiled starch for 30 min. at 40.degree.,
using such an amt. of the enzyme soln. as would result in the formation of
about 1/3 to 1/2 of the theoretically possible amt. of maltose, and detg.
the reducing sugar formed by titration with Fehling soln. It was found
that, when similarly purified by washing with very dil. alkali,
wheat , maize and rice starches show the same digestibility in the
sense that under the action of the same kind and amt. of ***amylase***
they are all ***transformed*** into reducing sugar at essentially the
same rate. When washed with H2O only, potato starch is almost pure but
the cereal starches seem to contain enough fatty or waxy matter to
interfere appreciably with the action of the enzymes even after the starch
has been dispersed by boiling in H2O 3 min. This is true to a greater
extent of maize than of ***wheat*** starch. Potato starch in general

shows a rate of enzymic hydrolysis equal to or slightly greater than that of the cereal starches, the only case in which it showed a distinctly lower rate of hydrolysis being one in which both the starch and the enzyme were highly purified; this tendency to abnormally low results is readily corrected by suitable additions to the digestion mixt., as will be shown in a subsequent paper.

L3 ANSWER 4 OF 8 CAPLUS COPYRIGHT 2003 ACS
 AB Disclosed is a method to facilitate the degrdn. of plant storage substances (starch, fat, etc.) by subjecting transgenic plant materials in a malting process, which transgenic plant expresses an enzyme that is active on degrading the storage substance(s), to obtain a degrdn. product such as cyclodextrins. A plant expression plasmid encoding cyclodextrin glycosyltransferase (CGTase) of Klebsiella pneumoniae or Bacillus macerans was prepd., which expression is under the control of barley .alpha.-
 amylase promoter or the maize polyubiquitin promoter, and used for the ***transformation*** of ***wheat*** or barley. The seeds harvested from the stably ***transformed*** ***wheat*** or barley plants were treated by: (1) steeping to produce chit ***malt***; (2) transferring the chit ***malt*** into a germination box to allow the seeds germinate to produce green ***malt*** expressing CGTase; and (3) converting starch with ***amylase*** into amylose which is subsequently converted into cyclodextrins by CGTase. The malted transgenic plant materials and/or malting soln. may be useful as a nutrient, pharmaceutical, or prophylactic compn.

L3 ANSWER 6 OF 8 CAPLUS COPYRIGHT 2003 ACS
AB A review with 41 refs. Over the last 5000 yr, cereals have been bred for food, feed, and beverages by selection of spontaneous mutations and random hybrids. Since the turn of the century, crosses with defined parents, and since 1927 artificially induced mutations, have been used to create

variability on which selection of new varieties is based. It is pointed out that hybrid corn and transfer of rust-resistant genes from wild species into chromosomes of bread ***wheat*** was preceded by decades of basic research. Genetic ***transformation*** is an addnl. tool for the breeder to introduce novel genes in a rational manner and will complement but not replace the existing efficient breeding methods.

Genetic ***transformation*** has been demonstrated in maize, rice, and ***wheat***, while techniques to obtain transgenic barley plants are still being developed. The authors' present knowledge on the endosperm-specific expression of storage proteins and the modulation of this expression by transcriptional activators is reviewed. Breeding strategies for altered protein quality and for proanthocyanidin-free malting barley are presented. Engineering of an improved ***malt*** enzyme, a heat stable (1-3, 1-4)-.beta.-glucanase, is described. The enzyme is expected to survive, like .alpha.- ***amylases***, the kilning process and has been shown to act efficiently in the mashing process for the elimination of water-sol. .beta.-glucans which impede filtration of wort. The engineered enzyme is expressed in ***transformed*** aleurone protoplasts and secreted from these cells

and

thus shown to be operational in the tissue, where it is expected to work. Hormone-regulated promoters for the expression of genes acting during grain development and malting have been characterized. Prospects for the prodn. of polyhydroxyalkanoates and cyclodextrins in cereal grains are discussed.

AB The concomitant saccharifying action on starch of 8 different barley ***malts*** in the presence of sweet potatoes, dry sweet-potato juice, sulfite ext., and aq. ext. of ***wheat*** flour, each as a supplementary source of .beta.- ***amylase***, was detd. The rate of reaction was proportional to the enzyme concn. up to 33% starch conversion for flour ***amylase*** and not more than 50% starch conversion for sweet-potato ***amylase***. Within these limits, it was found that the calcd. activity of ***malt*** and flour mixts. is about the same as the experimentally detd. activity, whereas the latter value tends to be higher than that calcd. for mixts. of sweet potato and ***malts*** high in .alpha.- ***amylase*** activity. Mixts. of ***malts*** and supplement in equiamylolytic amts. in fermentation tests gave higher alc. yield for the sweet-potato-supplemented mash. These results, which consistently demonstrate more extensive action in the presence of sweet potato, are consistent with the demonstration of appreciable concn. of

nonamylolytic enzymes therein concerned with sugar ***transformation***
